

Integration Testing (Encrypted Java)

The goal for integration dealt with implementing the encrypted chat with java code. For the final demo, we have not found any problems.

If you select the server, you must run the server before the client is running the app. After that you can chat each other, However if you select this option your chat will not be encrypted. If you select the client, you must know the server's IP (you can change it in the code). After that you can each other, and the Client's chat will be encrypted to the server automatically.

So, when you make discussion about a secret topic with you partner by chat, you can use this app. This app function is securing your chat by encrypting.
